

Dark samples

- Photoacoustic spectroscopy suits extremely well for the measurement of dark samples that have low transmittance or reflectivity on a wide spectral range
- The reason for this is that the photoacoustics is a direct absorption measurement technique – the higher the absorbance the higher the signal is
- With other techniques (transmission, ATR, DRIFT) proper spectra are difficult to obtain from dark samples due to the high absorption
- With the PA301 accessory no sample preparation is needed and contaminated sample cups can be discarded after use
